# Probability and probability laws

We introduce basic probability through the frequency interpretation[1]

- The treatment is non-measure theoretic

Foundation to this interpretation is some kind of **experiment**

- The experiment can be repeatedly performed
- The conditions are seemingly identical

As a result we have a series of **outcomes**

---

[1] Note that it is here irrelevant whether prior probabilities are assigned from relative frequency, by counting equilikely alternatives or by subjectively quantifying belief. Our focus is to deduce rules for doing operations on probabilities starting from axioms.

---

# Probability and probability laws (cont.)

Each **trial** of the experiment may have any number of specific outcomes

- Say, $1, 2, 3, \cdots, i, \cdots$

Each outcome $i$ either occurs or does not occur (on each trial)

Other legitimate outcomes

- $\underline{i}$, 'NOT $i$' (the non-occurrence of $i$)
- $i \wedge j$, '$i$ AND $j$' (occurrence of both $i$ and $j$)
- $i \vee j$, '$i$ OR $j$' (occurrence of either $i$ or $j$ or both)

Compounding of outcomes can be extended

$$i \wedge (j \wedge k) = (j \wedge i) \wedge k = \cdots = i \wedge j \wedge k$$
$$i \vee (j \vee k) = (j \vee i) \vee k = \cdots = i \vee j \vee k$$

We can also mix $\wedge$ and $\vee$, though those cases are complex

## Probability and probability laws (cont.)

Consider $n$ trials (repetitions) of some experiment

Let $m_n(i)$ the number of occurrences of outcome $i$

We define

$$p(i) = \lim_{n \to \infty} \frac{m_n(i)}{n} \tag{1}$$

If the limit exists, it is called the **probability** of outcome $i$

- (With respect to that experiment)

*'The probability that outcome $i$ will occur'*[2]

---
[2] We can of course replace $i$ with any compound outcome.

## Probability and probability laws (cont.)

The set of outcomes (say, $1, 2, 3, \cdots, N$) is said to be **mutually exclusive** if and only if not more than one of them can occur on the same trial

In this case, for any number of trials $n$

⤳ $m_n(i \wedge j) = 0$, for all $1 \le i \le j \le N$

Thus, by using the definition $p(i) = \lim_{n \to \infty} [m_n(i)/n]$

⤳ $p(i \wedge j) = 0$, for all $1 \le i \le j \le N$ $\tag{3}$

## Laws of probability (cont.)

A set of outcomes (say, $1, 2, 3, \cdots, N$) is said to be **collectively exhaustive** if and only if at least one of them occurs at every trial

In this case, for any number of trials $n$

$$\rightsquigarrow \quad m_n(1 \vee 2 \vee \cdots \vee N) = n$$

Again, by using the definition $p(i) = \lim_{n \to \infty} \left[ m_n(i)/n \right]$

$$\rightsquigarrow \quad p(1 \vee 2 \vee \cdots \vee N) = 1 \tag{4}$$

Joint variables

## Probability and probability laws (cont.)

**Interval law**

The probability $p(i)$ of any outcome $i$ is a real number in $[0, 1]$

$$\rightsquigarrow \quad 0 \leq p(i) \leq 1, \text{ for all } i \tag{5}$$

$\rightsquigarrow p(i) = 0$ corresponds to the case in which $i$ never occurs

$\rightsquigarrow p(i) = 1$ corresponds to the case in which $i$ always occurs

Since $0 \leq m_n(i) \leq n$, from $0 \leq m_n(i)/n \leq 1$ and $p(i) = \lim_{n \to \infty} \left[ m_n(i)/n \right]$

$\rightsquigarrow$ Outcome $i$ is impossible IFF $m_n(i) = 0$, for all $n$

$\rightsquigarrow$ Outcome $i$ is certain IFF $m_n(i) = n$, for all $n$

# Probability and probability laws (cont.)

**Addition law**

Consider $N$ mutually exclusive outcomes $1, 2, \cdots, N$

$$\rightsquigarrow \quad p(1 \vee 2 \vee \cdots \vee N) = p(1) + p(2) + \cdots + p(N) \qquad (6)$$

Mutually exclusive, no more than one of the outcomes can occur in one trial

So, we have

$$m_n(1 \vee 2 \vee \cdots \vee N) = m_n(1) + m_n(2) + \cdots + m_n(N), \text{ for all } n$$

Divide by $n$ and take the limit $n \to \infty$ with the definition of $p(i)$

## Probability and probability laws (cont.)

Consider the definition of probability and conditional probability

$$p(i) = \lim_{n \to \infty} \frac{m_n(i)}{n}$$

$$p(j|i) = \lim_{n \to \infty} \frac{m_n(i \wedge j)}{m_n(i)}$$

Consider the three laws of probability

$$0 \leq p(i) \leq 1$$
$$p(1 \vee 2 \vee \cdots \vee N) = p(1) + p(2) + \cdots + p(N)$$
$$p(i \wedge j) = p(i)p(j|i) = p(j)p(i|j)$$

We can combine the definition of mutual exclusivity $m_n(i \wedge j) = 0$ (for all $1 \leq i \leq j \leq N$) with the multiplication law $p(i \wedge j) = p(i)p(j|i) = p(j)p(i|j)$

- We assume that neither $p(i)$ nor $p(j)$ vanishes

Then, we deduce

$$p(i \wedge j) = 0 \quad \leadsto p(i|j) = 0 \quad \leadsto p(j|i) = 0$$
$$p(j|i) = 0 \quad \leadsto p(i|j) = 0 \quad \leadsto p(i \wedge j) = 0$$

**The Dirac delta function $\delta(x_1 - x_2)$**

We define the **Dirac delta function** as the function $\delta(x_1 - x_2)$

$$\delta(x_1 - x_2) = 0, \ \text{if} \ x_1 \neq x_2$$

$$\int_{-\infty}^{\infty} \mathrm{d}x_1 \delta(x_1 - x_2) = 1$$

$x_1$ and $x_2$ are any real variables

The two equations imply $\delta(x_2 - x_1) = \delta(x_1 - x_2)$

Moreover, the value of $\delta(0)$ is somehow undefined
  • $\delta(0)\mathrm{d}x = 1$, thus $\delta(0) = 1/\mathrm{d}x$

## General concepts (cont.)

The **distribution function** is also a function of a random variable $X$

- It is closely related to the density function of RV $X$

The definition

$$F(x) \equiv \mathrm{Prob}\{X < x\} \qquad (20)$$

The probability that a sample value of $X$ will be less than $x$

By combining the definition with $\mathrm{Prob}\{X \in [a, b]\} = \int_a^b P(x)\mathrm{d}x$, we get

$$\rightsquigarrow \quad F(x) = \int_{-\infty}^{x} P(x')\mathrm{d}x' \qquad (21)$$

By differentiation with respect to $x$, we get

$$\rightsquigarrow \quad P(x) = F'(x) \qquad (22)$$

Let $h$ be any univariate function

We define the **average** of function $h$

⤳ With respect to the RV $X$

$$\langle h(X)\rangle = \lim_{N\to\infty} \frac{1}{N}\sum_{i=1}^{N} h[x^{(i)}] \qquad (23)$$

$x^{(1)}, x^{(2)}, \ldots, x^{(N)}$ are values assumed by $X$ in $N$ independent samplings

Consider the usual definitions

$$P(x)\mathrm{d}x = \mathrm{Prob}\{X \in [x, x+\mathrm{d}x]\}$$

$$p(i) = \lim_{N\to\infty} [m_N(i)/N]$$

$P(x)\mathrm{d}x$ is the approximate fraction of any $N$ samples of $X$ in $[x, x+\mathrm{d}x)$

⤳ (The approximation becomes exact as $N\to\infty$)

$NP(x)\mathrm{d}x \times h(x)$ is the contribution to the sum from $X$ values in $[x, x+\mathrm{d}x)$

## Moments (cont.)

$$\langle h(X)\rangle = \lim_{N\to\infty} \frac{1}{N}\sum_{i=1}^{N} h[x^{(i)}]$$

We can approximate the sum

⤳ $$\sum_{i=1}^{N} h[x^{(i)}] \approx \int_{x=-\infty}^{\infty} [NP(x)\mathrm{d}x \times h(x)] = N\int_{-\infty}^{\infty} [P(x)\mathrm{d}x \times h(x)]$$

Divide by $N$ and take the limit $N\to\infty$ (so to get an equality)

⤳ $$\langle h(X)\rangle = \int_{-\infty}^{\infty} h(x)P(x)\mathrm{d}x \qquad (24)$$

The formula gives $\langle h(X)\rangle$ in terms of function $h$ and density $P$

- This form is analytically more convenient

## Moments (cont.)

Some useful averages

$$\langle X^n\rangle = \int_{-\infty}^{\infty} x^n P(x)\mathrm{d}x, \quad (n=1,2,\ldots) \qquad (25)$$

$\langle X^n\rangle$ is called the $n$-**th moment of** $X$

Remember the closure condition?

⤳ $$\langle X^0\rangle = \int_{-\infty}^{\infty} P(x)\mathrm{d}x = 1 \qquad (26)$$

Higher order moments may or may not exist (usually some exist, at least)

- The zero-th ($n=0$) order moment always exist!

## Moments (cont.)

$$\mathrm{var}\{X\} = \langle X^2 \rangle - \langle X \rangle^2$$

Note the non-negativity of the integrand in $\mathrm{var}\{X\} = \int_{-\infty}^{\infty} (x - \langle X \rangle)^2 P(x)\mathrm{d}x$

We have that $\mathrm{var}\{X\} \geq 0$

$$\rightsquigarrow \quad \langle X^2 \rangle \geq \langle X \rangle^2 \tag{31}$$

The equality holds if and only if $\mathrm{var}\{X\} = \langle (X - \langle X \rangle)^2 \rangle = 0$

$\rightsquigarrow$ This happens if and only if $X$ is the sure variable $\langle X \rangle$

- (Sure variables have zero variance)

*'If $var\{X\} = 0$, then $X$ is the sure variable $X = \langle X \rangle$'*

Probability

## Moments (cont.)

We can observe that $(X - \langle X \rangle)^2$ is strictly positive everywhere

- The only exception being $x = \langle X \rangle$ (where it is zero)

Suppose that $\mathrm{var}\{X\} = \int_{-\infty}^{\infty} (x - \langle X \rangle)^2 P(x)\,\mathrm{d}x = 0$

- $P(x)$ is never negative

Thus, we find the only possibility for the integral be equal zero

- $P(x)$ must be zero everywhere except possibly at $x = \langle X \rangle$

Because of normalisation, we must have $P(x) = \delta(x - \langle X \rangle)$

- This implies that $X$ is the sure variable $\langle X \rangle$

---

## Moments (cont.)

The reverse implication

'*The sure variable $X = \langle X \rangle$ has $var\{X\} = 0$*'

We can observe that for the sure variable $\langle X \rangle$ we have $P(x) = \delta(x - \langle X \rangle)$

We substitute into $\mathrm{var}\{X\} = \int_{-\infty}^{\infty} \underbrace{(x - \langle X \rangle)^2}_{f(x)} \underbrace{\delta(x - \langle X \rangle)}_{P(x)}\,\mathrm{d}x = f(\langle X \rangle) = 0$

$$\rightsquigarrow \quad \mathrm{var}\{X\} = 0$$

We used $\int_{-\infty}^{\infty} f(x)\delta(x - x_0)\,\mathrm{d}x = f(x_0)$ with $x_0 = \langle X \rangle$

## Moments (cont.)

**Standard deviation of $X$**

The square root for the variance of $X$ is called the **standard deviation**

The definition

$$\mathrm{sdev}\{X\} \equiv (\mathrm{var}\{X\})^{1/2} \equiv \langle (X - \langle X \rangle)^2 \rangle^{1/2}$$

$$= \left[ \langle X^2 \rangle - \langle X \rangle^2 \right]^{1/2} \quad (32)$$

$\mathrm{sdev}\{X\}$ is the square root of the average squared difference between $X$ and its mean $\langle X \rangle$, thus it measures the size of expected difference between the sample values of $X$ and the mean of $X$

- The size of the expected 'dispersion of' or 'fluctuation in' $X$ about $\langle X \rangle$

## Discrete variables

It is convenient to define RVs that can only take on discrete/integer values

A RV $X$ is said to be a **discrete random variable** if and only if there exists a function $P$ of an integer value $n$ such that $P(n)$ equals the probability of finding the value of $X$ to be precisely $n$

$$P(n) \equiv \text{Prob}\{X = n\} \qquad (45)$$

We again call $P$ the **density function** of $X$

## Discrete variables (cont.)

Any sample value of $X$ will surely take on some integer value in $(-\infty, \infty)$

Thus, we have,

$$\rightsquigarrow \quad \sum_{n=-\infty}^{\infty} P(n) = 1 \tag{47}$$

We call this equation the **normalisation** or **closure condition**

$P(n)$ is a probability (in $[0, 1]$), thus by the range law

$$\rightsquigarrow \quad 0 \geq P(n) \geq 1, \text{ for all } n \tag{48}$$

## Discrete variables (cont.)

Consider the **Kronecker delta function** $\delta(n, n_0)$

Suppose that the density function $P(n)$ is $\delta(n, n_0)$

$$P(n) = \delta(n, n_0) \equiv \begin{cases} 1, & n = n_0 \\ 0, & n \neq n_0 \end{cases} \tag{49}$$

From the definition of a density function, we have

$$\sum_{n=-\infty}^{\infty} P(n) = 1$$

$$P(n) \in [0, 1], \text{ for all } n$$

We have that function $\delta(n, n_0)$ satisfies all the requirements

⤳ Function $\delta(n, n_0)$ defines a discrete random variable $X$

⤳ RV $X$ will always be found at value $n_0$

---

Discrete variables

Joint variables

The Poisson RV can be understood as a special case of the binomial RV

- For $N$ very large and $p$ very small (Rare events)

$$P(n) = \begin{cases} \dfrac{e^{-a}a^n}{n!}, & n \geq 0 \\ 0, & n < 0 \end{cases}$$

Let $N$ be large and approximate the density function of the binomial RV

$$P(n) = \begin{cases} \dfrac{N!}{n!(N-n)!}p^n(1-p)^{N-n}, & 0 \geq n \geq N \\ 0, & n < 0 \text{ or } n > N \end{cases}$$

We have,

$$\frac{N!}{(N-n)!}p^n = N(N-1)\cdots(N-n+1)p^n \approx N^n p^n = (Np)^n$$

$$(1-p)^{N-n} \approx (1-p)^N = \left(1 - \frac{Np}{N}\right)^N \approx e^{-Np}$$

## Discrete variables (cont.)

Probability and random variable theory

UFC/DC
SA (CK0191)
2018.1

Probability and probability laws

Random variables

General concepts

Moments

Named variables

Discrete variables

Joint variables

$$\frac{N!}{(N-n)!}p^n = N(N-1)\cdots(N-n+1)p^n \approx N^n p^n = (Np)^n$$

$$(1-p)^{N-n} \approx (1-p)^N = \left(1 - \frac{Np}{N}\right)^N \approx e^{-Np}$$

As a result,

$$\frac{N!}{(N-n)!}p^n(1-p)^{N-n} \quad \overset{N\to\infty}{\rightsquigarrow} \underset{p=a/N}{\rightsquigarrow} \quad \frac{e^{-a}a^n}{n!} \tag{62}$$

For $N \to \infty$ and $p \to 0$ with $Np$ constant, the binomial RV with parameters $N$ and $p$ becomes the Poisson RV with mean and variance $Np$

## Discrete variables (cont.)

Named variables

Discrete variables

Joint variables

The logarithm approximation

$$\ln(1 + \varepsilon) \approx \varepsilon - \varepsilon^2/2, \text{ for } |\varepsilon| << 1$$

$\varepsilon = (n - a)/a$, so when $n \approx a$, the RHS is approximately equal to

$$-a\varepsilon^2/2 = -(n - a)^2/(2a)$$

We conclude

$$\frac{e^{-a} a^n}{n!} \approx \frac{1}{(2\pi a)^{1/2}} \exp\left[-\frac{(n - a)^2}{2a}\right], \quad (a >> 1) \tag{63}$$

When $a$ is sufficiently large, the Poisson RV with mean and variance $a$ approaches (at integer values) the normal RV with mean and variance $a$

---

Joint variables

## Joint random variables (cont.)

The joint, the marginal and the conditional density functions are interrelated

Consider the probability relations between three outcomes $1$, $2$ and $3$

For $(i,j,k)$ any permutation of $(1,2,3)$, we have

$$p(i \wedge j) = p(i)p(j|i)$$
$$p(1 \wedge 2 \wedge 3) = p(i \wedge j)p(k|i \wedge j)$$
$$p(1 \wedge 2 \wedge 3) = p(i)p(j \wedge k|i)$$

Now, identify outcome $i$ with '$X_i \in [x_i, x_i + dx_i]$'

## Joint random variables (cont.)

$$p(i \wedge j) = p(i)p(j|i)$$
$$p(1 \wedge 2 \wedge 3) = p(i \wedge j)p(k|i \wedge j)$$
$$p(1 \wedge 2 \wedge 3) = p(i)p(j \wedge k|i)$$

From the definitions of marginal and conditional probabilities, we have

$$P_{i,j}(x_i,x_j)dx_idx_j = P_i(x_i)dx_i \times P_j^{(i)}(x_j|x_i)dx_j$$

$$P(x_1,x_2,x_3)dx_1dx_2dx_3 = P_{i,j}(x_i,x_j)dx_idx_j \times P_k^{(i,j)}(x_k|x_i,x_j)dx_k$$

$$P(x_1,x_2,x_3)dx_1dx_2dx_3 = P_i(x_i)dx_i \times P_{j,k}^{(i)}(x_j,x_k|x_i)dx_jdx_k$$

Joint variables

## Joint random variables (cont.)

By eliminating the differentials, we get the equations

$$P_{i,j}(x_i,x_j) = P_i(x_i)P_j^{(i)}(x_j|x_i) \quad (77a)$$

$$P(x_1,x_2,x_3) = P_{i,j}(x_i,x_j)P_k^{(i,j)}(x_k|x_i,x_j) \quad (77b)$$

$$P(x_1,x_2,x_3) = P_i(x_i)P_{j,k}^{(i)}(x_j,x_k|x_i) \quad (77c)$$

They are valid for $(i,j,k)$ any permutation of $(1,2,3)$

The equations can be complemented by a forth equation[9]

$$P_{i,j}^{(k)}(x_i,x_j|x_k) = P_i^{(k)}(x_i|x_k)P_j^{(i,k)}(x_j|x_i,x_k) \quad (78)$$

---

[9] From subjecting the arguments of the first equation to condition $X_k = x_k$.

## Joint random variables (cont.)

**Statistical independence of random variables**

We define[12] **statistical independence** of RVs

For $(i, j, k)$ any permutation of $(1, 2, 3)$, we have

$$P_i(x_i) = P_i^{(j)}(x_i|x_j) = P_i^{(j,k)}(x_i|x_j, x_k) \qquad (89)$$

A necessary and sufficient condition for $X_1$, $X_2$ and $X_3$ to be statistically independent is that their joint density function $P(x_1, x_2, x_3)$ be equal to the product of their marginal density functions

$$\rightsquigarrow \quad P(x_1, x_2, x_3) = P_i(x_i) P_j(x_j) P_k(x_k) \qquad (90)$$

$\blacksquare$

---

[12] In analogy with the definition of statistical independence of outcomes.

## Joint random variables (cont.)

**Covariance**

We define the family of **covariances** of RVs $X_i$ and $X_j$

$$\mathrm{cov}\{X_i, X_j\} = \langle (X_i - \langle X_i \rangle)(X_j - \langle X_j \rangle) \rangle \tag{94a}$$

$$= \langle X_i X_j \rangle - \langle X_i \rangle \langle X_j \rangle \tag{94b}$$

The equivalence is based on the expression of $\langle h(X_i, X_j) \rangle$ and $\langle h(X_i) \rangle$

Compare $\mathrm{cov}\{X_i, X_j\} = \langle (X_i - \langle X_i \rangle)(X_j - \langle X_j \rangle) \rangle$ and $\mathrm{var}\{X\} = \langle X^2 \rangle - \langle X \rangle^2$

We have,

$$\mathrm{cov}\{X_i, X_i\} = \mathrm{var}\{X_i\} \tag{95}$$

Covariances are useful quantities regarding sets of joint RVs

## Conditioned averages

We define the family of **conditioned averages** of $h$

❶ With respect to the RVs $X_i$ and $X_j$

❷ Given that $X_j = x_j$

$$\langle h(X_i, X_j | X_j = x_j) \rangle \equiv \int_{-\infty}^{\infty} \mathrm{d}x_i h(x_i, x_j) P_i^{(j)}(x_i | x_j) \qquad (96)$$

Conditioned averages are seen as calculated by ignoring all samples in which the value of $X_j$ is not found to be equal (or infinitesimally close) to $x_j$

• (From the view point of sampling)

$$\langle h(X_1, X_2, X_3) \rangle \equiv \lim_{N \to \infty} \frac{1}{N} \sum_{n=1}^{N} h\big[x_1^{(n)}, x_2^{(n)}, x_3^{(n)}\big]$$

Conditioned means, conditioned variances, conditioned covariances all follow

■
